1本地安装openmpi

- 从网站下载openmpi
 - https://www.open-mpi.org
- Read INSTALL
- sudo mkdir –p /opt/openmp/4.0.0_gcc (这是安装目录)
- Mkdir build
- Cd build
- ../configure CC=gcc FC=gfortran CXX=g++
- --prefix=/opt/openmp/4.0.0_gcc
- Make –j4
- Make install (sudo)

2 环境变量设置

```
Vi ~/.bashrc
export MPI_LOC=/opt/openmpi/4.0.0_gcc
export MPI_LIB=$MPI_LOC/lib
export MPI_INCLUDE=$MPI_LOC/bin
export LD_LIBRARY_PATH=$MPI_LOC/lib:$LD_LIBRARY_PATH
PATH=$MPI_LOC/bin:$PATH; export PATH
Source ~/.bashrc
```

3 曙光服务器设置

- 登录已经申请的曙光服务器
- 申请一个节点登录(合肥为例):
 - salloc -N -1 -n 8 -p kshdnormal (自己确定队列名)
 - ssh "the node"
 - module avail (查看环境)
 - which mpirun (会发现已经安装intel mpi)
 - muodule load

编译第一个MPI程序

- 编译程序 (注意曙光服务器在申请节点操作)
 - mpicc -o hello hello.c
- 运行程序
 - mpirun –np 4 hello
- slurm 提交作业
 - 见示例文件
